Our intent with Aquaponics Life is to bring you a new way of creating and playing your own adventures! Take a farm, or even a city, and use its resources to produce food. Monitor the fish to grow and harvest them, or skip that and just let them eat. Do what you will, but in the end, everything is for your own consumption! In the absence of a "world" map to show off your adventuring, we present a "Metaworld" map. Take on quests, discover dungeons, and roam the countryside if you must, but the actions you take in your own world will affect your character's future. Your entire party can fight off hordes of monsters in one Quest, spend their loot in shops, and go fishing in the ocean... and if you want to play with your food, this is the most flexible farming simulation RPG yet created. Why 4E? With 4E becoming the new standard of role-playing, there wasn't a good reason to choose 5th. It didn't matter if Aquaponics Life was an early proof of concept or an already-established deep RPG, it always felt like 4E could hold all of its expansions. A simple, honest conversion that takes full advantage of the mechanics and features of the base 5th edition ruleset. If you'd like to learn more, check out our forums, where you can get in-depth tutorial videos, our Patreon, and visit us on Google+ or Discord! Because you'd like your 20 free copies. Game Designers: Charles Surette Charles Surette has been enjoying fantasy role-playing games since he played Dungeons and Dragons at the age of 12. His earliest experiences with the genre were with pencil and paper RPGs like Swords & Wizardry and Shadowrun. After moving on to more modern RPGs (Dragonlance and Shadowrun), he ran one-off campaigns with friends and made a few tutorials for Guild of Dungeoneers in the then-new Pathfinder RPG. Eventually, he felt that he had enough material to create something more serious, so he entered into the slow and arduous development of Aquaponics Life. Charles worked on Aquaponics Life while he was a senior at Montclair State University, where he majored in Life Sciences and minored in Physics and Astronomy. He enjoys using his time in school to study human anatomy and physiology, biology, and genetics. He is currently working at Kings of Battle and is developing 10th Edition

What's new:

Gladiator: Sword of Vengeance (originally titled Gladiator: Fate of the World) is a 2008 action-adventure platform video game developed by Matrix Games and based on the popular film Gladiator. Set in 61 AD, the setting is drawn from the events surrounding the feast of the Roman Emperor Vespasian, which instituted the Flavian dynasty, 122 years after the Battle of Actium. The game follows the events of a historical Babylonian game of gladiators in the aftermath of the victory of the Emperor's legions in North Africa. Players control the gladiator Juba as he must save his friend, his city and the whole world from a great villain, Kaiser Totigis. The game was pitched towards a mature audience, using a thematic approach to bring the central theme of social and environmental concerns to the forefront. It provides a unique "cosmopolitan" twist as players are put into the frame as gods controlling the fate of an entire city and all Roman territories around the world, unlocking the resources of humanity, society and nature. Though the game is clearly inspired by the movie Gladiator, the designers sought to make a darker and more mature experience. Development began in 2006 by an internal team at game developer Matrix Games. The art style is similar to the atmosphere of the film, with the developers using the color red in the style of the film's production designer. Matrix was limited in its development by studios LucasArts and Bullfrog Productions due to excessive budgeting and lack of work agreement. A month before release, it was revealed that development was being moved back to former World Rally Championship team, Codemasters, who started work in June 2007. The team announced their intention to release the game in late August. Gladiator: Sword of Vengeance was released for Microsoft Windows, PlayStation 3 and Xbox 360 on 20 August 2008. Juba: The Sword of Vengeance, an offshoot of the game, was released exclusively for Wii and Nintendo DS on 31 January 2009 in North America. Reviews of the game were mixed. Most reviewers felt it was too violent for younger players, and criticized the story and dialogue. The PC version was also excluded from the iTunes Store due to its excessive use of sex and violence, prompting Sega and EA to blacklist Square Enix from selling games via their iTunes Stores. It sold averagely in Europe, in part due to a 400% price increase on its release. Plot In 61 AD, the Emperor of Rome, Titus Flavius Vespasianus,

Climate change is occurring and likely to accelerate because of greenhouse gas emissions, heat stress, and shifting and accumulating precipitation. These changes will affect the performance of maize in the contiguous United States. Climate change will affect pest and disease outbreaks, the result of which will be crop losses. Using a model of the U.S. maize system, we have addressed the interrelationships of climate change, land disturbance, and pest and disease outbreaks with changes in U.S. maize yields. We explored the effect of climate change (decadal means) on maize yield, the optimal time to sow, the optimal time to plant within row, and the proportions of the crop being sown before the first and the last frost, relative to the typical spring and fall flowering dates. Our model predicts that yields will increase and there will be little change in the optimal time to sow and the optimal time to plant within row, because the former will be in a cooler climate and the latter in warmer climate. Across all transitions, the optimal time to plant within row will shift forward by 4 weeks in the northern United States and backward by 14 weeks in the southern United States, in response to warming temperatures, but this change is offset by a reduction in the proportion of the crop being sown before the first frost. Predicted pest and disease outbreaks will have little impact on yield, but they will have a significant impact on the optimal time to plant within row. The optimum is shifted by about 5 weeks forward in the northern United States and backward by 10 weeks in the southern United States in response to precipitation effects, but again this is offset by a reduction in the proportion of the
